# Top-Down Parsing

# Outline

- Predictive Parsing
- First Sets
- Follow Sets
- LL(1) Parsing Tables

# Predictive Parsers

- Like recursive-descent but parser can “predict” which production to use
  - By looking at the next few tokens
  - No backtracking
- Predictive parsers accept LL(k) grammars
  - L means “left-to-right” scan of input
  - L means “leftmost derivation”
  - k means “predict based on k tokens of lookahead”
  - In practice, LL(1) is used

# LL(1) vs. Recursive Descent

- In recursive-descent,
  - At each step, many choices of production to use
  - Backtracking used to undo bad choices
- In LL(1),
  - At each step, only one choice of production
  - That is
    - When a non-terminal  $A$  is leftmost in a derivation
    - The next input symbol is  $t$
    - There is a unique production  $A \rightarrow \alpha$  to use
      - Or no production to use (an error state)
- LL(1) is a recursive descent variant without backtracking

# Predictive Parsing and Left Factoring

- Recall the grammar

$$E \rightarrow T + E \mid T$$

$$T \rightarrow \text{int} \mid \text{int} * T \mid ( E )$$

- Hard to predict because
  - For  $T$  two productions start with  $\text{int}$
  - For  $E$  it is not clear how to predict
- It is not easy to predict which production to use based on only a single token
- This grammar is not LL(1)
- We need to left-factor the grammar (Rewrite the grammar)

# Left- Factoring Example

- Recall the grammar

$$E \rightarrow T + E \mid T$$

$$T \rightarrow \text{int} \mid \text{int} * T \mid ( E )$$

- Factor out common prefixes of productions into a single production*
- Introduce a new non-terminal for the suffixes of the productions that are left factored and write them as alternatives.*
- Then, it will be multiple productions, one for each suffix.*

$$E \rightarrow T X$$

$$X \rightarrow + E \mid \varepsilon$$

$$T \rightarrow ( E ) \mid \text{int } Y$$

$$Y \rightarrow * T \mid \varepsilon$$

# Quiz

Choose the alternative that correctly left factors “if” statements in the given grammar

$$\begin{aligned} \text{EXPR} &\rightarrow \text{if BOOL then } \{ \text{EXPR} \} \\ &\quad | \text{if BOOL then } \{ \text{EXPR} \} \text{ else } \{ \text{EXPR} \} \\ &\quad | \dots \\ \text{BOOL} &\rightarrow \text{true} \mid \text{false} \end{aligned}$$

☐ 
$$\begin{aligned} \text{EXPR} &\rightarrow \text{if true then } \{ \text{EXPR} \} \\ &\quad | \text{if false then } \{ \text{EXPR} \} \\ &\quad | \text{if true then } \{ \text{EXPR} \} \text{ else } \{ \text{EXPR} \} \\ &\quad | \text{if false then } \{ \text{EXPR} \} \text{ else } \{ \text{EXPR} \} \\ &\quad | \dots \end{aligned}$$

☐ 
$$\begin{aligned} \text{EXPR} &\rightarrow \text{EXPR}' \mid \text{EXPR}' \text{ else } \{ \text{EXPR} \} \\ \text{EXPR}' &\rightarrow \text{if BOOL then } \{ \text{EXPR} \} \\ &\quad | \dots \\ \text{BOOL} &\rightarrow \text{true} \mid \text{false} \end{aligned}$$

☐ 
$$\begin{aligned} \text{EXPR} &\rightarrow \text{if BOOL EXPR}' \\ &\quad | \dots \\ \text{EXPR}' &\rightarrow \text{then } \{ \text{EXPR} \} \\ &\quad | \text{then } \{ \text{EXPR} \} \text{ else } \{ \text{EXPR} \} \\ \text{BOOL} &\rightarrow \text{true} \mid \text{false} \end{aligned}$$

☐ 
$$\begin{aligned} \text{EXPR} &\rightarrow \text{if BOOL then } \{ \text{EXPR} \} \text{ EXPR}' \\ &\quad | \dots \\ \text{EXPR}' &\rightarrow \text{else } \{ \text{EXPR} \} \mid \varepsilon \\ \text{BOOL} &\rightarrow \text{true} \mid \text{false} \end{aligned}$$

# LL(1) Parsing Table Example

- Left-factored grammar

$$E \rightarrow TX$$

$$X \rightarrow + E \mid \varepsilon$$

$$T \rightarrow (E) \mid \text{int}Y$$

$$Y \rightarrow *T \mid \varepsilon$$

- The LL(1) parsing table:

	int	*	+	(	)	\$
E						
X						
T						
Y						

next input token

leftmost non-terminal

rhs of production to use

# LL(1) Parsing Table Example (Cont.)

- Consider the  $[E, \text{int}]$  entry
  - “When current non-terminal is  $E$  and next input is  $\text{int}$ , use production  $E \rightarrow TX$ ”
  - This can generate an  $\text{int}$  in the first position
- Consider the  $[Y, +]$  entry
  - “When current non-terminal is  $Y$  and current token is  $+$ , get rid of  $Y$ ”
  - $Y$  can be followed by  $+$  only if  $Y \rightarrow \varepsilon$

# LL(1) Parsing Tables. Errors

- Blank entries indicate error situations
- Consider the  $[E, *]$  entry
  - “There is no way to derive a string starting with  $*$  from non-terminal  $E$ ”

# LL(1) Parsing Table Example

- Left-factored grammar

$$E \rightarrow TX$$

$$X \rightarrow + E \mid \varepsilon$$

$$T \rightarrow (E) \mid \text{int} Y$$

$$Y \rightarrow * T \mid \varepsilon$$

- The LL(1) parsing table:

	int	*	+	(	)	\$
E	TX			TX		
X			+E		$\varepsilon$	$\varepsilon$
T	int Y			(E)		
Y		*T	$\varepsilon$		$\varepsilon$	$\varepsilon$

# Using Parsing Tables

- Method similar to recursive descent, except
  - For the leftmost non-terminal  $S$
  - We look at the next input token  $a$
  - And choose the production shown at  $[S,a]$
- A stack records frontier of parse tree
  - Non-terminals that have yet to be expanded
  - Terminals that have yet to be matched against the input
  - Top of stack = leftmost pending terminal or non-terminal
- Reject on reaching error state
- Accept on end of input & empty stack

# LL(1) Parsing Algorithm

```
initialize stack = <S $> and next
repeat
  case stack of
    <X, rest> : if T[X, *next] = Y1...Yn
                  then stack ← <Y1... Yn
                  rest>;
                  else error ();
    <t, rest> : if t == *next ++
                  then stack ← <rest>;
                  else error ();
until stack == < >
```

# LL(1) Parsing Example

Stack	Input	Action
E \$	int * int \$	T X
T X \$	int * int \$	int Y
int Y X \$	int * int \$	terminal
Y X \$	* int \$	* T
* T X \$	* int \$	terminal
T X \$	int \$	int Y
int Y X \$	int \$	terminal
Y X \$	\$	$\epsilon$
X \$	\$	$\epsilon$
\$	\$	ACCEPT

# Quiz

Choose the next parse state given the grammar, parse table, and current state below. The initial string is:

if true then { true } else { if false then { false } } \$

	if	then	else	{	}	true	false	\$
E	if B then { E } E'				$\epsilon$	B	B	$\epsilon$
E'			else { E }		$\epsilon$			$\epsilon$
B						true	false	

	Stack	Input
Current	E' \$	else { if false then { false } } \$
<input type="radio"/>	\$	\$
<input type="radio"/>	else { E } \$	else { if false then { false } } \$
<input type="radio"/>	E } \$	if false then { false } } \$
<input type="radio"/>	else { if B then { E } E' } \$	else { if false then { false } } \$

$E \rightarrow \text{if B then } \{ E \} E' \mid B \mid \epsilon$   
 $E' \rightarrow \text{else } \{ E \} \mid \epsilon$   
 $B \rightarrow \text{true} \mid \text{false}$

# Computing First Sets

## Definition

$$\text{First}(X) = \{ t \mid X \rightarrow^* t\alpha \} \cup \{ \varepsilon \mid X \rightarrow^* \varepsilon \}$$

## Algorithm sketch:

1.  $\text{First}(t) = \{ t \}$
2.  $\varepsilon \in \text{First}(X)$ 
  - if  $X \rightarrow \varepsilon$
  - if  $X \rightarrow A_1 \dots A_n$  and  $\varepsilon \in \text{First}(A_i)$  for  $1 \leq i \leq n$
3.  $\text{First}(\alpha) \subseteq \text{First}(X)$  if  $X \rightarrow A_1 \dots A_n \alpha$  and  $\varepsilon \in \text{First}(A_i)$  for  $1 \leq i \leq n$

# First Sets. Example

- Recall the grammar

$$E \rightarrow T X$$

$$T \rightarrow ( E ) \mid \text{int } Y$$

$$X \rightarrow + E \mid \varepsilon$$

$$Y \rightarrow * T \mid \varepsilon$$

- First sets

$$\text{First}( ( ) ) = \{ ( \}$$

$$\text{First}( ) ) = \{ ) \}$$

$$\text{First}( \text{int} ) = \{ \text{int} \}$$

$$\text{First}( + ) = \{ + \}$$

$$\text{First}( * ) = \{ * \}$$

$$\text{First}( T ) = \{ \text{int}, ( \}$$

$$\text{First}( E ) = \{ \text{int}, ( \}$$

$$\text{First}( X ) = \{ +, \varepsilon \}$$

$$\text{First}( Y ) = \{ *, \varepsilon \}$$

# Computing Follow Sets

- Definition:

$$\text{Follow}(X) = \{ t \mid S \rightarrow^* \beta X t \delta \}$$

- Intuition
  - If  $X \rightarrow A B$  then  $\text{First}(B) \subseteq \text{Follow}(A)$  and  $\text{Follow}(X) \subseteq \text{Follow}(B)$
  - if  $B \rightarrow^* \varepsilon$  then  $\text{Follow}(X) \subseteq \text{Follow}(A)$
- If  $S$  is the start symbol then  $\$ \in \text{Follow}(S)$

# Computing Follow Sets (Cont.)

Algorithm sketch:

1.  $\$ \in \text{Follow}(S)$
2.  $\text{First}(\beta) - \{\epsilon\} \subseteq \text{Follow}(X)$ 
  - For each production  $A \rightarrow \alpha X \beta$
3.  $\text{Follow}(A) \subseteq \text{Follow}(X)$ 
  - For each production  $A \rightarrow \alpha X \beta$  where  $\epsilon \in \text{First}(\beta)$

# Follow Sets. Example

- Recall the grammar

$$E \rightarrow TX$$

$$T \rightarrow (E) \mid \text{int}Y$$

$$X \rightarrow +E \mid \varepsilon$$

$$Y \rightarrow *T \mid \varepsilon$$

- Follow sets

$$\text{Follow}(+) = \{\text{int}, (\}$$

$$\text{Follow}(*) = \{\text{int}, (\}$$

$$\text{Follow}( ( ) = \{\text{int}, (\}$$

$$\text{Follow}(E) = \{), \$\}$$

$$\text{Follow}(X) = \{ \$, ) \}$$

$$\text{Follow}(T) = \{+, ), \$\}$$

$$\text{Follow}( ) ) = \{+, ), \$\}$$

$$\text{Follow}(Y) = \{+, ), \$\}$$

$$\text{Follow}(\text{int}) = \{*, +, ), \$\}$$

# Constructing Parsing Tables: The Intuition

- Consider non-terminal  $A$ , production  $A \rightarrow \alpha$ , & token  $t$
- $T[A, t] = \alpha$  in two cases:
- If  $\alpha \rightarrow^* t \beta$ 
  - $\alpha$  can derive a  $t$  in the first position
  - We say that  $t \in \text{First}(\alpha)$
- If  $A \rightarrow \alpha$  and  $\alpha \rightarrow^* \varepsilon$  and  $S \rightarrow^* \beta A t \delta$ 
  - Useful if stack has  $A$ , input is  $t$ , and  $A$  cannot derive  $t$
  - In this case only option is to get rid of  $A$  (by deriving  $\varepsilon$ )
    - Can work only if  $t$  can follow  $A$  in at least one derivation
  - We say  $t \in \text{Follow}(A)$

# Constructing LL(1) Parsing Tables

- Construct a parsing table  $T$  for CFG  $G$
- For each production  $A \rightarrow \alpha$  in  $G$  do:
  - For each terminal  $t \in \text{First}(\alpha)$  do
$$T[A, t] = \alpha$$
  - If  $\epsilon \in \text{First}(\alpha)$ , for each  $t \in \text{Follow}(A)$  do
$$T[A, t] = \alpha$$
  - If  $\epsilon \in \text{First}(\alpha)$  and  $\$ \in \text{Follow}(A)$  do
$$T[A, \$] = \alpha$$

# Notes on LL(1) Parsing Tables

- If any entry is multiply defined then  $G$  is not LL(1)
- This means:
  - If  $G$  is ambiguous
  - If  $G$  is left recursive
  - If  $G$  is not left-factored
  - And in other cases as well
- Most programming language CFGs are not LL(1)

*Thanks*
